Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1894 Excerpt: .diagonal of that A should begin at 4. The submarginals on the dark edges 65 and 31 are monozones, each of which can, by undercreasing its other two triangles, place its zonal trace in three positions, and thus the two together can, still occupying 65 and 31, give to H $3-3 = 9$ configurations. Further, these four submarginals can occupy the edges 43, 21, 65, and 31 in 24 different ways, and by the same changes of two concealed marginal triangles turn H into $24-9 = 216$ equivalent H s, all of which have been virtually handled by us, and have each given us the same number T.S of 40-partitioned 71-gons. Thus we have constructed more than 2,000 millions of billions of them, namely, $216.T.S = 2163 Ms+879189M2 + 964800M$. Each of them could be crowned upon its 23 marginal triangles by a different asymmetric propyramidal 23-ace, and the similar 216TS 23-aces could be by one entry registered as a small fraction of all the asymmetrical propyramidal 23-aces, built by other belts on other irreducibles, that are to be found among the asymmetric summits of the 72-acral 63-edra. But since, in the solution of the problem of the Polyedra, no asymmetric summits are obtained by coronation, none of these 40-partitioned 71-gons are required in that solution. All asymmetric summits, the --aces, -aces, c., are given in that theory by their reciprocal --gons, -gons, c., in the 63-acral 72-edra, which faces are obtained by their edges, constructed...
